

TESTING SOLUTIONS TO FIT YOUR OPERATIONAL NEEDS
Objective Data | Many Options | Customizable Solutions

COVID-19 Testing to Mitigate the Impact of the Virus on Your Worksite

Our COVID-19 Testing Services provide objective data that helps reduce the risk of COVID-19 worksite exposure. We have experience performing turnkey COVID-19 Testing solutions in a wide range of settings and can tailor our testing solutions to meet each client's needs.

KEY COMPONENTS:

MOLECULAR TESTING

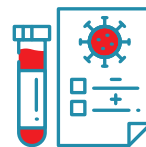

Molecular or RT-PCR testing is used to determine whether an individual is actively infected with the virus that causes COVID-19. We can collect the samples from the individual via a swab of the nasal passageway or saliva. The sample is then shipped off-site and analyzed in a laboratory. From arrival at the lab, results are generally delivered within 24 hours.

RAPID ON-SITE TESTING

Rapid on-site testing, also known as point of care testing, while less accurate than laboratory-based molecular testing, allows employers to see testing results quickly. When used appropriately, faster results can mean speedier decision-making and reduced risk.

COLLECTION METHODS:

RMI COLLECTION

We can bring RMI testing staff to our client's location to facilitate onsite collection. This fully managed approach is ideal for situations where there is a large population on the worksite.

SELF COLLECTION

Depending on our client's requirements we can ship kits to their worksite or to their individual employees for self collection. This simple, user friendly approach is ideal for smaller worksites or traveling employees.

COVID-19 RAPID ON-SITE TESTING

Our COVID-19 Rapid On-Site Testing Services provide quick turnaround data that allow key stakeholders to make informed decisions faster. With Rapid Onsite Testing, results can be delivered in as little as 15 minutes. This helps to reduce the risk of COVID-19 worksite exposure while maintaining efficient operations.

CONSIDERATIONS

RAPID TESTING VS. LAB BASED TESTING

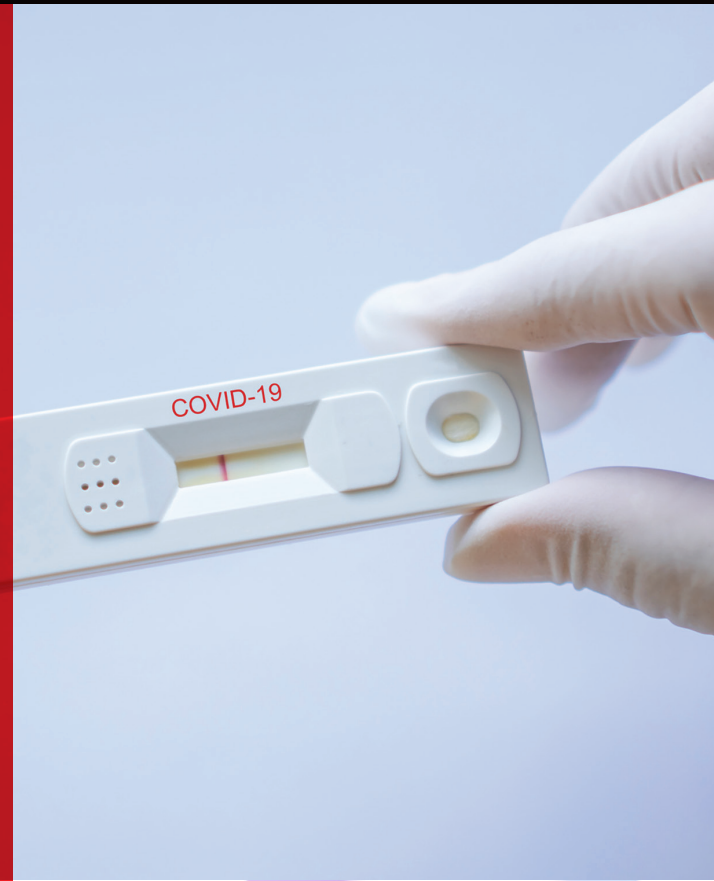

Lab-based PCR testing provides the most accurate results but the turnaround time for those results is generally around 24 hours. On-site rapid testing, while much less accurate, can provide results in as little as 15 minutes from time of collection.

RAPID TEST TYPES

RMI can offer a wide range of rapid on-site testing options including rapid PCR, rapid antigen, and rapid LAMP. These tests are collected via nasal swab and can provide a result in as little as 15 minutes. The rapid PCR and LAMP tests are more sensitive (fewer false negatives), however, in some cases rapid antigen tests may have a much higher throughput which means they can be more cost-effective for high-volume testing.

A TURNKEY SOLUTION

Whether you are interested in antigen testing or rapid PCR testing, RMI is prepared to assist. RMI can provide all of the necessary solutions to deliver Rapid On-Site Testing Services, providing your organization with a truly hands-off experience.
